

Creation of Receipt Lines

Purpose

- After generating the receipt header, individual receipt lines must be added.
 - Each line corresponds to a storage medium to be put into stock.
 - Receipt lines capture: item code, quantity, quality, and any traceability information if required.
-

Mandatory Information for Each Line

1. Item code – must exist in SpeedWMS; cannot receive unregistered items.
 2. Quantity – always expressed in units per storage medium.
 3. Quality – default quality comes from the item sheet or activity default.
 4. Traceability info – required if the item is configured for traceability (lot, DLC, DLUO, etc.).
 5. Owner – automatically populated if defined on item or activity; can be manually selected from allowed third parties.
-

Methods to Add Receipt Lines

1. Direct Addition

- Enter item code, quantity, and quality directly in the code field.

2. Search by Item Code

- Right-click the code field → Search for an article.
- Can display items attached to the supplier or all items using “All Suppliers”.
- Select the item → automatically fills the code field; enter quantity and quality.

3. Add via Grid Pattern

- Access item templates registered in the activity from the code field contextual menu.
- Enter quantities:
 - All column → same quantity for all items sharing a main characteristic.

- Individual column → quantity per specific reference.
- Validated quantities generate receipt lines displayed in the receipt window.

4. Detailed Entry Form

- Double-click the code field → opens detailed entry form.
- Allows filling all available fields for a receipt line.
- Supports multiple logistic variants and traceability fields if configured.
- Useful for complex items requiring lot/batch tracking.

5. Import via Excel

- Excel file must have 3 columns: item code, quantity, quality code.
- Features:
 - Unknown item code column flags items not existing in Speed.
 - Import first line toggle for headers.
 - Preview shows data as it will be imported.
- Validation → creates receipt lines automatically.
- Can modify the receiving dock or update previously entered lines during import.

Important Notes

- Added lines are not immediately in stock; stock generation must be performed separately.
- Receipt lines can be modified or deleted via contextual menu before stock generation without affecting system history.
- If associated with expected items, consumption is not recorded until stock entry movement occurs.
- Supports bulk entry with splitting over multiple storage media if required.
