

Gauge (Settings / Items / Gauges)

The Gauge feature in SpeedWMS allows you to qualify the dimensions of locations and the objects to be stored. It helps ensure items fit in their assigned slots and can be used for calculating occupancy rates.

Capabilities

- View all existing gauge codes in the system.
- Create new gauge codes.
- Modify properties of an existing gauge.
- Delete a gauge (with constraints).

Gauge Sheet Fields

Field	Description
Gauge Code	Unique identifier for the gauge. Alphanumeric, max 10 characters.
Gauge Designation	Label or name of the gauge.
Pallet Equivalent	Numeric value used to calculate space occupancy.
Application Scope	Determines whether the gauge applies to: - Supports (items to store), - Slots (locations), - Or both.
Occupation Dimensions	If applied to supports, specifies the physical dimensions of the support. Can be used in location search procedures to ensure compatibility, e.g., considering rail width before storage.

Notes:

- The gauge is useful for automated location searches to determine if a support can fit in a given slot.
- Helps maintain efficient space utilization and avoid errors during stock placement.
