

SpeedWMS – Location Search

Access:

- **Menu: Settings → Locations → Location Search**
-

Purpose:

- **Suggests the optimal destination location for each stock medium.**
 - **Uses predefined rules and criteria to guide operators to the correct storage slot.**
-

Available Actions:

- **Create new location search rules.**
- **Modify existing rules.**
- **Delete rules (with constraints).**

Multiple location search rules can exist for the same activity.

Rule Structure:

- **Each location search rule is made of sequences.**
- **Each sequence has a method:**
 - 1. Search location in structure**
 - **Finds the first empty slot in a storage area.**
 - 2. Search as close as possible to picking**
 - **Finds the first empty slot near the picking location of the item.**
 - 3. Search by complement**
 - **Finds a location already occupied by the same item reference.**
 - 4. Fixed search**
 - **Returns a predetermined fixed location.**
 - 5. Free search**
 - **Custom method for specific needs; configurable only by BK Systems teams.**

Each method can be refined with criteria such as classification, size, quality, or weight. Multiple methods can be combined within a single rule, and multiple sequences of the same method can exist within a rule.

Sequence Execution Logic:

- Sequences are executed in the order defined within the rule.
- Possible outcomes for each sequence:
 1. No location found → Move to next sequence (or end search if none remain).
 2. Location found → Proposed to the operator; end of search.

Best practice: Configure sequences to perform the most precise searches first, with broader searches in later sequences.

Usage:

- Location search rules can be linked to Speed item sheets, ensuring the system proposes the best location based on the item characteristics and warehouse rules.
