

SpeedWMS – Reception Principle

Purpose:

Define the two methods of handling incoming goods (receptions) in SpeedWMS, and explain how expected quantities are tracked and received.

1. Reception Methods

A. Portfolio of Expected Items

- **Expected items correspond to arrival announcements or supplier purchase orders.**
- **These can be entered:**
 - **Manually by the user, or**
 - **Automatically via an interface from an external system (e.g., N+1 sales management system).**
- **At the end of the reception process, SpeedWMS allows the generation of a comparative report between:**
 - **Quantities expected and**
 - **Quantities actually received.**

B. Reception Module

- **Receptions are carried out declaratively, based on the items physically received.**
 - **Receptions can be fed by an interface or processed via:**
 - **Radio Frequency (RF) module, or**
 - **Manual entry.**
-

2. Key Notes

- **The choice of method depends on the business process and whether pre-notification of arrivals is available.**
- **Comparative reporting in expected items ensures accurate tracking and stock reconciliation.**
