

SpeedWMS – Receiving Tab SOP

Purpose:

The Receiving Tab controls the default item qualities, ownership, and the behavior of the receiving radio module during receipt or return of goods.

1. Tab Structure

The tab has two sub-tabs:

1. **Default Qualities & Ownership** – assign quality and owner for items.
 2. **Receiving Radio Module Behavior** – configure operator input fields and defaults.
-

2. Default Qualities & Ownership

- **Default Quality:**
 - Assign the quality that will automatically apply to items during receipt or return.
 - If no quality is entered, the system applies the activity's default quality.
 - **Default Owner:**
 - Assign an owner for the item; the system displays all third parties flagged as "owner".
 - If no owner is specified, the activity's default owner is applied.
-

3. Receiving Radio Module Behavior

- Controls how operators interact with the quantity entry fields on the RF module.
 - **Left List:** select the fields where operators can enter quantities.
 - **Right List:** define which field is active by default when the quantity entry screen opens.
-

4. Notes

- **Proper configuration ensures accuracy in quality and ownership assignment.**
- **Streamlines the workflow for operators using the receiving radio module.**
- **Any defaults set here are inherited automatically if not manually overridden during receipt.**
