

Sequence Creation – RAG-Friendly Version

Purpose:

The Sequence Creation function in SpeedWMS allows users to quickly generate multiple warehouse locations in bulk, including all relevant characteristics. This streamlines large-scale location creation compared to unitary/manual entry.

1. Key Capabilities

- Create sequences of locations with multiple characteristics simultaneously.
 - Supports copy-paste from Excel for bulk data entry.
 - Ensures unique location names, preventing duplicates during creation.
-

2. Required Fields

- Warehouse: alphanumeric, max 6 characters (mandatory)
 - Aisle/Driveway: alphanumeric, max 3 characters (mandatory)
 - Column: alphanumeric, max 3 characters
 - Level: alphanumeric, max 3 characters
 - Slot/Box: alphanumeric, max 3 characters
-

3. Location Name Construction

- Specify start position and length of each element to include in the location name:
 - Example: 1.6 → start at character 1, length 6
 - Example: 0.0 → element excluded from location name
 - Define a separator between elements if required.
 - A preview of generated names is displayed before final validation.
-

4. Process Steps

1. Enter lists of values for each characteristic (direct entry or Excel copy).
2. Configure the location name construction parameters.

3. Click **Generate** to preview the sequence of locations.
 4. Review the preview table to ensure accuracy.
 5. Click **Validate** to create the locations in the system.
-

5. Notes

- SpeedWMS validates uniqueness of each location name before creation.
- Duplicate entries in the preview will not be created or added to the system.
- Only the warehouse and aisle fields are mandatory; all other characteristics are optional but recommended for clarity and organization.
