

owns – RAG-Friendly Version

Purpose:

Manage the list of cities in SpeedWMS to ensure accurate order processing and transport planning.

1. Overview

- **Towns provide standardized location information used for orders and transport planning.**
 - **Each town entry ensures consistency in logistics operations, especially for deliveries and e-commerce fulfillment.**
-

2. Access

- **Navigate via: Settings → Third Parties → Towns.**
 - **Towns can be imported from a file or managed directly in the system.**
-

3. Data Fields

Each town entry contains the following information:

- **Country Code – ISO code of the country**
 - **Town Name – Name of the city**
 - **Postcode – Postal code for the city**
 - **INSEE Code – National statistics code (for France; optional in other regions)**
-

4. Usage

- **Town data is validated during order entry to prevent incorrect delivery locations.**
 - **Towns are also used in the transport planning module to optimize routes and assignments.**
-

5. Summary

- **Maintaining an accurate list of towns improves order accuracy, delivery efficiency, and transport planning reliability.**
- **Regular updates and imports ensure the system reflects current geographical data.**
