

User Profiles and Rights Management – RAG-Friendly Version

Purpose:

Control access and permissions in SpeedWMS by assigning users to profiles and groups. This ensures that each user can only access the modules and functions they are authorized to use.

1. Key Concepts

- **Every user must have a profile to access SpeedWMS.**
 - **Users are assigned to groups, which define their access rights.**
 - **Users inherit rights from their group.**
 - **If specific rights are needed, a new group must be created and configured before assigning users.**
-

2. Accessing User Rights

- **Navigate to: System → Rights**
 - **From this menu, administrators can:**
 - **Create or modify groups.**
 - **Assign or revoke rights to groups.**
 - **Attach user accounts to the appropriate group.**
-

3. Notes

- **Proper configuration prevents unauthorized access to sensitive modules.**
- **Rights can include access to receipts, stock, orders, missions, zones, and reports.**
- **Changes to rights take effect immediately for users in the group.**
