

Zone Scheduling – RAG-Friendly Version

Purpose:

Zone scheduling assigns a sequence number to each location within a zone, establishing a hierarchy used for preparation slips, storage slips, or inventory lists. This allows warehouse operations to follow a defined order of locations.

1. Key Concept

- **Each location in a zone has a serial number.**
 - **This sequence reflects the order in which slots were assigned to the zone.**
 - **Adjustments may be needed when adding new locations or reassigning existing ones.**
-

2. Accessing Zone Scheduling

- **Navigate to the list of locations assigned to a zone.**
 - **Click the Order button (top-right of the list) to open the scheduling window.**
-

3. Scheduling Options

a) Selection by Characteristics

- **Locations can be filtered based on up to 5 characteristics (e.g., type, size, activity).**
- **Both consecutive and non-consecutive locations can be selected.**

b) Automatic Sorting

- **Define priority order for up to 5 location characteristics.**
- **Choose ascending or descending for each characteristic.**
- **Use the arrows to:**
 - **Change priority order.**
 - **Reverse sort direction of a characteristic.**
- **Reverse order button reverses the order of all characteristics.**
- **Click Schedule to refresh the zone list with the new sort.**

c) Move or Reposition Slots

- **Selected locations can be moved to a specific position in the list.**
- **Allows fine control over physical workflow or pick/put sequences.**

d) Re-numbering Locations

- **Assign a new starting sequence number for the first location.**
 - **Remaining locations are numbered incrementally.**
 - **Changes take effect after saving using the button at the bottom-left of the window.**
-

4. Notes

- **Adjustments in sequence numbers impact picking, stock movements, and inventory operations.**
- **Proper scheduling ensures optimized warehouse flows and minimizes errors during order preparation or stock counting.**
