BUSINESS CONTEXT

4.1 Business Requirement

Within the L'ORÉAL activity, the client requires that:

 When closing a reception,

If there are still pending expected lines (not received) linked to the current reception DO reference,

These pending lines must be automatically settled (closed).

4.2 Why This Control Is Required

This control aims to:

Prevent reporting inconsistencies

- When a reception is closed, reception data is transmitted.
- The DO reference is closed.
- The same DO reference must NOT be receivable again in another reception.

Clean the reception backlog (expected lines portfolio)

- An expected line with the same BL reference as a closed reception can no longer be processed by operators.
 - The client would otherwise need to resend a new expected line.
-

4.3 Clarification Regarding DO References

Speed technically allows multiple DO references per reception.

However, for this activity:

 One reception = One DO reference

Therefore:

The logic must use:

REE_NOFO = BL Reference (REA_BL)

The pending expected lines to settle must match:

- The DO reference of the reception
 - The BL reference (REE_NOFO)
-

4.4 Radio Behavior

There will be:

 No reception closure allowed from radio.

This option will be blocked.

Closure is handled only in Speed Admin.

CONFIGURATION PARAMETER

Parameter	Description
-----------	-------------

ACT_TOP21	Enables or disables automatic settlement logic
-----------	--

If:

ACT_TOP21 = 1

→ Apply settlement logic.

If:

ACT_TOP21 = 0

→ Standard behavior (no automatic settlement).

TECHNICAL IMPLEMENTATION

6.1 Entry Point Used

Entry Point Description

PE22 Triggered after reception closure in Speed Admin

6.2 Functional Trigger

Trigger occurs:

When:

- A reception is selected
- User clicks the "Close" button
- Reception closure is completed

Then:

→ Execute additional logic via PE22.

6.3 PE22 – Pending Line Settlement Logic

Condition

IF ACT_TOP21 = 1

Then execute the following:

Step 1 – Verify Pending Lines

After reception closure:

Check if there are remaining expected lines (attendus):

- Linked to the same DO reference
 - Matching BL reference (REE_NOFO = REA_BL)
 - Not fully consumed
-

Step 2 – Behavior

Case 1 – No Remaining Expected Lines

If no pending expected lines exist:

→ Do nothing.

Case 2 – Remaining Expected Lines Exist

If pending expected lines remain:

→ Automatically settle (close) the remaining expected lines for that reception.

6.4 Logical Flow (Pseudo-code)

IF ACT_TOP21 = 1 THEN

 reception_DO = CURRENT_RECEPTION_DO

 reception_BL = REE_NOFO

 pending_lines = GET_EXPECTED_LINES(

 DO = reception_DO,

 BL = reception_BL,

 status = NOT_CONSUMED

)

 IF pending_lines IS NOT EMPTY THEN

 FOR each line IN pending_lines:

 SET line.status = CLOSED

 ENDFOR

 ENDIF

ENDIF

7 FUNCTIONAL SUMMARY (RAG-Optimized)

What triggers this logic?

Reception closure in Speed Admin.

Is radio affected?

Yes – radio closure is blocked.

No settlement logic runs from radio.

Which parameter controls activation?

ACT_TOP21

Which entry point is used?

PE22

What is the matching key?

- DO reference
- BL reference (REE_NOFO = REA_BL)

What happens if pending expected lines remain?

They are automatically settled.

What happens if none remain?

Nothing.

8 TECHNICAL IMPACT

- No new tables created.
 - No UI modification.
 - Logic only executed at reception closure.
 - Ensures data consistency.
 - Prevents re-processing of closed DO references.
 - Cleans reception backlog.
-

CLIENT VALIDATION

AGL acknowledges receipt and validates all elements described in this document.

BK Systèmes commits to delivering the solution that meets the validated requirements within the agreed quotation framework.

Any additional requests or modifications beyond this document may require a separate quotation.

Any provisions not explicitly stated in this document are not covered and remain at the discretion of the concerned parties.
