

Project: L'ORÉAL

Feature: Reception Generation Control – DO Reference Consistency

Version: 1.1

Date: 14/04/2025 – 15/04/2025

Author: AKD

◆ **DOCUMENT METADATA (for Vector DB)**

```
{  
  "document_type": "Technical Specification",  
  "project": "L'OREAL",  
  "system": "Speed WMS",  
  "module": "Expected Portfolio / Reception Generation",  
  "process_events": ["PE 165", "PE 822"],  
  "activity_parameter": "ACT_TOP20",  
  "speed_version": "A.8.6.F => 28.06b1"  
}
```

◆ **SECTION 1 — Business Context**

1.1 Functional Requirement

Within the L'ORÉAL activity, the client requires that during reception generation, a control must ensure:

1. All selected expected lines belong to the same DO reference.
 2. No expected line linked to that DO reference remains unselected.
 3. Only one DO reference is present in the reception being generated.
-

1.2 Why This Control Is Required

When a reception is closed:

- Reception data is transmitted.

- The DO reference is closed.
- The same DO reference must not be processed again in another reception.

If not properly controlled:

- Reporting inconsistencies may occur.
 - Partial receptions could leave unprocessed expected lines.
 - Multiple DO references could incorrectly be grouped into one reception.
-

1.3 Mandatory Reception Generation Method

Reception must only be generated via:

Print RN (Print BR)

Therefore, access to the following options must be blocked:

From Expected Line Level:

- Generate BL
- Generate Reception

From Expected Header Level:

- Print BL
- Generate BL
- Generate Reception

These options must be disabled (greyed out or hidden) via user rights configuration.

1.4 Activation Parameter

The control must be activated via the activity parameter:

ACT_TOP20

If:

ACT_TOP20 = 1

→ The blocking logic is active.

If:

ACT_TOP20 = 0

→ Standard behavior applies.

◆ SECTION 2 — Technical Design

2.1 Control at “Print RN” (Print BR)

When the operator selects:

"Print RN"

From the Expected Portfolio screen:

A validation must be performed to verify:

- No expected line with the same DO reference remains unselected.
-

2.2 Blocking Rule

If there exists at least one expected line:

- With the same DO reference
- Not selected in the current reception generation

Then:

→ Reception generation must be blocked.

Error Messages to Display

English:

"Please select all the expected items with the same DO reference."

"Warning, not all of the expected lines in this BL have been selected."

French:

« Veuillez sélectionner tous les attendus ayant la même réf DO. »

« Attention, toutes les lignes attendues dans ce BL n'ont pas été sélectionnées. »

2.3 Control for Multiple DO References

Additionally, it must be verified that:

All selected expected lines belong to one single DO reference.

It is not allowed to generate one reception containing multiple DO references.

If the operator selects expected lines from more than one DO reference:

→ Block the process.

Error Message

English:

"Warning, several expected lines that do not belong to the same reception have been selected."

French:

« Attention, plusieurs lignes d'attendu n'appartenant pas à la même réception ont été sélectionnées. »

◆ SECTION 3 — Technical Implementation

3.1 Entry Points Used

Entry Point Purpose

PE 165 Reception generation validation

PE 822 Reception generation validation

3.2 Core Logic — PE 165 / PE 822

Activation Condition

IF ACT_TOP20 = 1

Step 1 — Validate Single DO Reference

Check:

- All selected expected lines must have the same DO reference.

If more than one DO reference is detected:

DISPLAY_ERROR("Multiple DO references selected")

lbContinuerTraitement = FALSE

EXIT_STANDARD_PROCESS

Step 2 — Validate Complete Selection

Check:

- **If any expected line with the same DO reference remains unselected.**

If at least one unselected line exists:

DISPLAY_ERROR("Not all expected lines with same DO selected")

lbContinuerTraitement = FALSE

EXIT_STANDARD_PROCESS

Step 3 — Continue Processing

If:

- **Only one DO reference selected**
- **All expected lines with that DO are selected**

Then:

→ Continue standard reception generation process.

◆ SECTION 4 — Logical Flow (Pseudo-Code)

IF ACT_TOP20 = 1 THEN

selected_lines = GET_SELECTED_EXPECTED_LINES()

unique_do_list = GET_DISTINCT_DO(selected_lines)

IF COUNT(unique_do_list) > 1 THEN

DISPLAY_ERROR("Multiple DO references selected")

lbContinuerTraitement = FALSE

RETURN

ENDIF

current_do = unique_do_list[0]

remaining_lines = GET_UNSELECTED_LINES_WITH_DO(current_do)

IF remaining_lines IS NOT EMPTY THEN

DISPLAY_ERROR("Not all expected lines with same DO selected")

lbContinuerTraitement = FALSE

RETURN

ENDIF

ENDIF

CONTINUE_STANDARD_PROCESS

◆ **SECTION 5 — User Rights Configuration**

The following options must be disabled (hidden or greyed):

From Expected Header:

- **Print BL**
- **Generate BL**
- **Generate Reception**

From Expected Lines:

- **Generate BL**
- **Generate Reception**

Reception generation must only be possible via:

Print RN

◆ **SECTION 6 — Functional Summary (RAG-Optimized)**

What activates this logic?

ACT_TOP20

Which entry points are used?

PE 165 and PE 822

When is validation triggered?

When clicking "Print RN"

What is validated?

- **Only one DO reference selected**
- **All expected lines with that DO are selected**

What happens if validation fails?

Reception generation is blocked.

◆ **SECTION 7 — Client Validation**

AGL acknowledges receipt and validates all elements described in this document.

BK Systèmes commits to delivering the solution that meets the validated requirements within the scope of the approved quotation.

Any additional request or evolution beyond this document may be subject to additional quotation.

Any provision not explicitly stated in this document is not covered and remains at the discretion of the concerned parties.
