

Workshop Approach

Access

- **Menu: Manufacturing → Workshop Approach**
 - **Opens a window where the user selects the workshops (production areas) concerned by the operation.**
-

Purpose

- **Before production can start via radio frequency (RF) transactions, the required component quantities must be approached (moved) to the workshop.**
 - **The system will move stock supports (containers, pallets, etc.) from storage to the workshop for manufacturing.**
-

How it Works

1. MO & Production Area Link

- **Each Manufacturing Order (MO) is associated with a production area (workshop).**

2. Stock Movement

- **From the MO lines, the system updates the status of stock supports to Status 03, indicating they are ready for the workshop.**

3. Operator Validation

- **Operators validate these movements via RF transactions to confirm that components are physically in the workshop.**

4. Location Search Rules

- **If the rule moves goods directly to the production location, they are ready for immediate use.**
 - **If the rule moves goods to a storage area in the workshop, the RF Approach Workshop transaction must be used to move them to the production location.**
-

Key Notes

- **This step ensures that all components are physically available at the correct workshop before production begins.**
- **It prevents shortages during manufacturing and ensures traceability of components moved to the workshop.**
