

Carrier Search and Assignment Overview

Purpose:

- Automatically assign the correct carrier code to selected orders.
- Uses predefined sequences configured in the Transport / Carrier Assignment module.

Access:

- Contextual menu after selecting one or more orders in status “In Seizure” in the order portfolio.

Functionality

1. SpeedWMS checks the configured carrier assignment sequences.
2. It evaluates each selected order against the sequence criteria (e.g., recipient, order type, destination).
3. Once the matching sequence is found, the carrier code is automatically updated on the order.

Key Notes

- Only affects orders that are in seizure (status 010).
- The sequences must be properly configured in Settings / Transport / Carrier Assignment to ensure correct automatic assignment.
- Useful to streamline transport planning and reduce manual errors in carrier selection.
