

Order Distribution

This function automatically distributes received goods to different customers according to predefined models and can transform received products into prepared products immediately.

Steps in the Distribution Process

Step 1: Creation of Models

- Define recipient codes (customers).
- Specify distribution percentages for each recipient.
- ⚠ If percentages aren't fixed, the model can be created with 0%, and percentages can be entered later after importing data.

Step 2: Creation of the Distribution Header

- Import the distribution model.
- Enter the supplier code for the received goods.

Step 3: Entry of Lines to be Received

- Input the items and quantities to be received, as usual in receipt entry.

Step 4: Generation of the Distribution

- Validation triggers the automatic actions:
 1. Stock creation – the received goods are added to stock.
 2. Creation of different orders – based on the distribution model.
 3. Validation of the different orders – automatically confirms them.
 4. Edition of validation notes – prepares documents for reference.

Note: You can configure the system to not automatically validate orders, if needed.

✅ Key Points:

- Distribution can be automatic and immediate, turning receipts into prepared products.
- Percentages can be preset or updated post-import.

- **Validation of orders can be automatic or manual, depending on configuration.**
