

Put in Wave (Order Wave Management)

Purpose

- **Allows grouping of multiple orders for simultaneous processing during preparation.**
 - **Ensures efficient generation of sampling missions for orders in the same wave.**
 - **Manual wave management is rarely needed; SpeedWMS automatically handles waves in most cases.**
-

Process

1. Automatic wave assignment:

- **When launching orders for preparation, SpeedWMS automatically assigns them to a wave.**
- **All selected orders in the batch are grouped in the same preparation wave.**

2. Manual wave creation:

- **Can be done for specific processes if needed.**
- **Orders can be assigned to a new wave manually via the interface.**

3. Wave status:

- **Orders in a wave move from the input tab to the wave tab in the order portfolio.**
- **This allows tracking of all orders associated with waves.**

4. Repositioning orders:

- **A wave order can be moved back to seizure/input status through the context menu.**
- **This removes the order from the wave and allows it to be reassigned.**

5. Wave overview:

- **Clicking the Waves tab in the preparation window provides a global view of all waves in progress:**
 - **Status of each wave**

- **Orders associated with each wave**
-

 Tips:

- **Rely on automatic wave assignment for efficiency; manual intervention is only for exceptions.**
- **Always check the Waves tab to ensure orders are properly grouped before generating missions.**
