

## **SOP: Creating Receipt Lines in Speed WMS**

**Sensitivity: Internal**

---

### **1. Purpose**

To describe the standard procedure for adding receipt lines to an existing receipt header in Speed WMS.

Each receipt line represents one storage medium that will later be generated into stock.

---

### **2. Prerequisite**

- A receipt header must already exist and be open.
  - Receipt lines are added before stock generation.
  - No stock movement is created until stock generation is performed.
- 

### **3. General Rules for Receipt Lines**

Regardless of the input method used, the following rules always apply:

- Item code must exist
  - It is not possible to receive an item that does not have an article master (item sheet) in Speed WMS.
- Quantity is always stored in units per storage medium
  - Even if entered in alternative logistic units, Speed converts and stores quantities in units.
- Default quality
  - Taken from the item sheet or the default activity configuration.
- Traceability fields
  - Fields such as Lot, Lot2, DLC, DLUO, etc. are mandatory if configured on the item sheet.
- Owner assignment
  - Automatically populated if defined on:
    1. The item sheet (priority), or

## **2. The activity**

- If no owner is predefined, the user must select one from the list of authorized owners.

---

## **4. Minimum Required Information**

**Each receipt line requires at least:**

- Item Code
- Quantity to be received
- Quality code

---

## **5. Methods for Adding Receipt Lines**

**Speed WMS provides multiple ways to add receipt lines. All methods create the same result.**

---

### **5.1 Direct Addition (Manual Entry)**

- Enter the item code directly in the *New Receipt Line* field.
- Enter the quantity and quality.
- Validate to create the line.

**Use case:**

**Fast entry when the item code is known.**

---

### **5.2 Addition by Item Search**

- Right-click in the Item Code field.
- Select Search for an Article.
- The system displays items linked to the receipt supplier.
- Enable All Suppliers to view all items in the activity.
- Select the item → item code is auto-filled.
- Enter quantity and quality, then validate.

**Use case:**

**When item code is unknown or needs confirmation.**

---

### **5.3 Addition Using Item Templates (Grid Pattern)**

- **Right-click in the Item Code field.**
- **Select Item Templates.**
- **Choose a predefined template linked to the activity.**
- **Enter quantities:**
  - **All column: same quantity for all references**
  - **Individual columns: different quantities per reference**
- **Validate to generate multiple receipt lines at once.**

**Use case:**

**Bulk or standardized receipts.**

---

### **5.4 Addition via Detailed Entry Form**

- **Double-click in the Item Code field.**
- **The detailed entry screen opens.**
- **Allows access to:**
  - **All logistic units**
  - **Traceability fields**
  - **Advanced item attributes**
- **Mandatory traceability fields become editable if required by the item.**
- **Validate to create the receipt line.**

**Use case:**

**Complex items requiring traceability or advanced data entry.**

---

### **5.5 Addition by Excel Import**

- **Click the Excel Import icon.**
- **Paste or import an Excel file containing exactly three columns in this order:**

1. Item Code
2. Quantity
3. Quality Code

**Import options:**

- **Unknown Item Code** column displays items not existing in Speed.
- **Import First Line** determines whether the first row is imported.
- **Preview / Printing** shows how data will be imported.
- **Validate** creates the receipt lines.

**Use case:**

**Mass receipt creation from external systems.**

---

## **6. Reception Dock Handling**

- The reception dock is initially inherited from the receipt header.
  - If the dock is changed on the header after lines already exist, Speed prompts the user to:
    1. Keep existing lines unchanged, or
    2. Update the dock on all existing receipt lines
- 

## **7. Receipt Line Status Before Stock Generation**

- Receipt lines are saved but not yet in stock.
  - Field **Tick Stock Input** remains set to 0.
  - No stock movement (MVT\_DAT) is created.
  - Supplier expected quantities are not consumed yet.
  - Receipt lines can still be:
    - **Modified**
    - **Deleted**  
without impacting Speed history.
- 

## **8. Stock Generation (Next Step)**

- **Receipt lines only become stock after Stock Generation is executed.**
  - **Stock generation:**
    - **Creates records in STK\_DAT**
    - **Creates movement records in MVT\_DAT**
    - **Consumes expected quantities if linked to a supplier order**
- 

## **9. Related Tables**

- **REE\_DAT – Receipt Header**
  - **REL\_DAT – Receipt Lines**
  - **STK\_DAT – Stock**
  - **MVT\_DAT – Movements**
- 

## **10. Common RAG Questions This SOP Supports**

- ***How do I add receipt lines in Speed WMS?***
- ***What information is mandatory for a receipt line?***
- ***Why don't receipt lines appear in stock immediately?***
- ***How does Excel import work for receipts?***
- ***Where are receipt lines stored in the database?***
