
SOP: Import of Expected Items in Speed WMS

Sensitivity: Internal

1. Purpose

This procedure explains how to import a list of expected items into Speed WMS using an Excel file.

Expected items are used to prepare and control incoming receipts before the physical goods arrive.

This process is typically used by Receiving teams to preload receipt expectations.

2. Functional Scope

- **Module: Receiving / Expected**
 - **Business Object: Expected Receipt Items**
 - **Related Tables (Database Reference):**
 - **Expected Receipt Header: REA_DAT** (*depending on configuration*)
 - **Expected Receipt Lines: REL_DAT** (*used when generating receipts*)
 - **Receipt Header (after generation): REE_DAT**
-

3. Preconditions

Before importing expected items, ensure that:

- **You are logged into the correct activity (ACT_CODE)**
 - **The supplier and customer account exist in Speed**
 - **All item codes in the Excel file exist in the article master**
 - **The Excel file follows the required format**
-

4. Accessing the Import Function

- 1. Navigate to Receiving**
- 2. Open the Expected menu**

3. Select an existing expected receipt or create a new one
4. Click the Import button

This action opens the Expected Items Import screen.

5. Excel File Requirements

The import is performed using an existing Excel file.

5.1 Mandatory Column Structure

The Excel file must contain the expected items data in a predefined structure (as configured in the activity).

Typically required fields include:

- Item Code
- Expected Quantity
- Quality Code
- *(Optional depending on configuration)*
 - Lot
 - DLUO / DLC
 - Owner

Important

- Item codes must exist in Speed
 - Traceability fields are mandatory if managed on the item sheet
 - Quantities are interpreted in units per storage medium
-

6. Import Process

1. Click Import
2. Browse and select the Excel file
3. Load the file into the import screen
4. Review the imported data:
 - Valid item codes

- Quantities
- Quality codes

5. Validate the import

Once validated:

- Expected item lines are created
- The expected receipt is updated with imported lines

7. System Behavior After Import

After a successful import:

- Expected items are visible under Receiving → Expected
- No stock is created at this stage
- No movement is recorded
- The data is used later when:
 - Creating a receipt
 - Matching received quantities against expected quantities

8. Error Handling & Validation

8.1 Common Import Errors

Error	Cause	Resolution
Item not found	Item code does not exist	Create item or correct code
Missing traceability Lot / DLUO required		Update Excel file
Quantity invalid	Zero or non-numeric value	Correct quantity

8.2 SQL Validation (Optional – Support Use)

```
SELECT *
FROM REL_DAT
WHERE ACT_CODE = 'RSAJHBJP'
```

AND REE_NORE = 'EXPECTED_NUMBER';

Use this query to verify that:

- Expected lines were created
 - Quantities and item codes are correct
-

9. Best Practices

- Always validate Excel data before importing
 - Use expected items to:
 - Reduce receiving errors
 - Speed up receipt creation
 - Improve traceability accuracy
 - Do not import duplicate expected lines for the same receipt
 - Keep the original Excel file for audit and troubleshooting
-

10. RAG-Optimized Key Concepts

Concept	Meaning
Expected Items	Planned receipt lines before goods arrival
Import	Excel-based preload of expected data
No Stock Impact	Import does not generate stock
Traceability	Mandatory if configured on item
Validation	Ensures clean receipt creation later

11. Typical RAG Questions Answered

- How do I import expected items in Speed WMS?
- What is the Excel format for expected items?
- Does importing expected items create stock?
- Where do imported expected items appear?

- **Why does my expected item import fail?**
-
