

SOP: Management of Expected Receptions in Speed WMS

Sensitivity: Internal

1. Purpose

This SOP explains how to view, manage, and process expected receptions in Speed WMS.

Expected receptions are used to anticipate incoming goods (purchase orders or returns) before physical receipt and to control receiving accuracy.

2. Functional Scope

- **Module: Receiving → Expected**
 - **Business Process: Expected Receipts Management**
 - **Applicable for:**
 - **Purchase Orders**
 - **Returns of Goods**
-

3. Definition: Expected Reception

An expected reception line represents:

- **A quantity of a specific item**
- **Expected to be received**
- **For a given order reference (usually supplier PO)**
- **With a planned receipt date**

Each expected reception line is consumed when a corresponding stock entry movement is created in Speed.

⚠ Important:

Expected receptions do not create stock on their own.

Stock is only created when a receipt is generated and validated.

4. Accessing Expected Receptions

- 1. Navigate to Receiving**

2. Select Expected

This opens the Expected Receptions Management screen, displaying all expected reception data for the current activity.

5. Display Modes

Speed allows two different display modes for expected receptions.

5.1 Expected Reception Headers View

This view groups expected lines by expected reception header (order-level view).

Used when:

- Managing receipts by supplier or PO
 - Initiating reception for multiple lines at once
-

5.2 Expected Items Portfolio View

This view displays individual expected item lines.

Used when:

- Managing quantities at item level
 - Modifying or deleting specific expected lines
-

5.3 Configuring the Display Mode

The display mode is controlled via global settings:

Path:

System → Global → Module → Expected

The user must define whether the screen opens in:

- Header view
 - Item portfolio (line-level) view
-

6. Status Management

Expected receptions are organized by status, which reflects their progression in the receiving process.

Typical lifecycle:

- 1. Expected created**
- 2. Expected linked to a receipt**
- 3. Quantity consumed when stock entry occurs**
- 4. Expected closed once fully consumed**

Consumption occurs only when an entry movement into stock is recorded.

7. Available Actions

From the Expected Receptions screen, users can:

7.1 Create Expected Reception Lines

- **Manually create new expected lines**
 - **Define item, quantity, quality, planned date**
 - **Interface creation (external import) is also supported**
-

7.2 Modify Expected Reception Lines

- **Update quantities, dates, or references**
 - **Changes can be applied:**
 - **Individually**
 - **Globally (bulk updates)**
-

7.3 Import Expected Receptions from File

- **Import a list of expected items (Excel or interface file)**
 - **Used for bulk creation from supplier data or ERP**
-

7.4 Delete Expected Reception Lines

- **Allowed only if:**
 - **The expected line is not already consumed**
 - **No stock entry movement is linked**

- **System constraints apply to prevent data inconsistency**
-

7.5 Initiate the Reception Process

- **Select one or more expected lines**
 - **Use the contextual menu**
 - **Associate selected expected lines with a Speed receipt**
 - **This action launches the receipt creation process**
-

8. Business Rules & Behavior

- **One expected line = one planned receipt quantity**
 - **Partial consumption is allowed**
 - **Consumption = quantity received into stock**
 - **Expected lines remain editable until consumption starts**
 - **Once stock entry is validated, expected quantities are reduced**
-

9. Data Model Reference (Support / RAG Context)

Object	Table
Expected Reception Header	REA_DAT
Expected Reception Lines	REL_DAT
Receipt Header	REE_DAT
Stock Entry Movement	MVT_DAT

10. Common RAG Questions This SOP Answers

- **What is an expected reception in Speed?**
- **How do expected receptions work?**
- **When is an expected quantity consumed?**
- **How do I initiate a receipt from expected items?**

- **Can expected receptions be deleted or modified?**
 - **Why does an expected line remain open after receipt creation?**
-

11. Best Practices

- **Always use expected receptions for planned deliveries**
- **Import expected items for large or repetitive receipts**
- **Do not delete expected lines that are partially consumed**
- **Validate expected data before linking to a receipt**
- **Use item-level view for detailed control**
