

SOP: Reception Handling Principles in Speed WMS

Sensitivity: Internal

1. Purpose

This SOP explains the two supported methods for handling receptions in **Speed WMS**, including their use cases and operational principles.

2. Reception Handling Methods Overview

Receptions in Speed WMS can be managed using **one of two methods**:

1. **Reception based on Expected Items**
2. **Reception based on Declarative Entry**

Each method serves a different operational need and workflow.

3. Reception Based on Expected Items

3.1 Description

This method manages receptions using a **portfolio of expected items**. Expected items represent **advance arrival announcements** or **supplier purchase orders**.

Expected items may be:

- Entered manually in Speed WMS
- Imported via an interface
- Synchronized from an external system (e.g., sales management or ERP system)

3.2 Operational Principle

- Each expected item defines:
 - Item reference
 - Expected quantity
 - Order-giver reference
 - Planned reception date
- During reception, received quantities are **matched against expected quantities**.

- When stock is received and an **inbound stock movement** is created, the expected quantity is **consumed**.

3.3 Output and Controls

- At the end of the reception process, Speed WMS can generate a **comparison between expected quantities and received quantities**.
 - This method is recommended when:
 - Purchase orders are known in advance
 - Quantity reconciliation is required
 - Supplier performance tracking is needed
-

4. Reception Based on Declarative Entry

4.1 Description

This method manages receptions **without prior expected items**. The reception is created **based on what is physically received** at the warehouse.

4.2 Operational Principle

- Receptions are declared directly in the **Reception module**
- Item quantities are entered manually or via an interface
- No expected item comparison is required

4.3 Input Methods

Receptions can be performed using:

- Manual data entry
- Interface-fed data
- Radio Frequency (RF) module (see RF documentation)

4.4 Recommended Use Cases

This method is recommended when:

- Expected data is unavailable or unreliable
 - Urgent or unplanned deliveries occur
 - Simplified reception is required
-

5. Method Selection Guidelines

Scenario	Recommended Method
Known purchase orders	Expected Items
Quantity reconciliation required	Expected Items
Unplanned delivery	Declarative Reception
RF-based reception	Declarative or Expected
ERP-integrated workflow	Expected Items
