

Support Break Management – RAG-Friendly Version

Purpose:

The support break feature allows Speed WMS to automatically split large incoming quantities into multiple storage supports during receipt line creation, based on the packaging plan defined in the item sheet.

1. Parameter Location

- Found in the Storage tab of each item sheet.
 - Activated per stock unit (SU) type configured on the item.
 - Determines how quantities are split across storage media when creating receipt lines.
-

2. Behavior Without Support Break

- Example:
 - Item pallet = 750 units
 - Received quantity = 4 pallets → 3000 units
 - If support break is not activated:
 - A single receipt line will contain the entire 3000 units.
 - To match the actual pallets, 4 separate receipt lines must be created manually.
-

3. Behavior With Support Break Activated

- Support break activated on Pallet SU:
 - System automatically splits the incoming quantity into multiple storage supports according to the item's packaging plan.
- Example:
 - Received quantity = 10000 units
 - Support break splits:
 - 2 supports of 4500 units each
 - 1 support for the remaining 1000 units

- **Benefits:**
 - **Optimizes administrative entry of incoming goods**
 - **Ensures receipt lines match the physical pallets received**
-

4. Rules & Notes

- **The number and size of supports generated depend on the item sheet packaging plan.**
- **Only quantities that comply with the item's packaging plan can be automatically split.**
- **If the received pallets do not comply with the packaging plan, manual adjustment is needed.**
