

Topic: Principle of Picking Replenishment

Core Concept: Replenishment is the process of moving stock to picking locations to ensure availability for order fulfillment. Its setup and execution follow specific rules.

1. Prerequisites & Setup

To enable the creation of replenishments, the following master data must be configured:

- **Picking Zones must be defined.**
- **Picking Locations must be established and associated with one or more picking zones.**

2. Replenishment Rules & Source Logic

- **Source Restriction:** A picking location can be replenished from another picking location, provided the source location does not belong to the same picking area (zone).
- **Parameter Management:** Replenishment rules (e.g., min/max levels) are typically defined at the picking zone level.
 - **Exception & Priority:** Specific parameters can be defined at the individual item level. These item-specific settings take priority over the zone-level parameters.

3. Execution & Validation Workflow

Launching a replenishment generates replenishment lines, which are initially "orphan" task lines not yet assigned to a move.

- **Generation:** The process can be triggered manually or automatically (e.g., via batch job).
- **Validation Modes:** These lines are converted into executable warehouse transfers using one of three validation methods:
 1. **Administrative Validation:** Confirmed directly from the list of replenishment lines in the backend system.
 2. **Transfer Validation:** Executed via the storage radio frequency (RF) transaction on a mobile device, validating the physical transfer.
 3. **Replenishment Validation:** Executed via the replenishment RF transaction on a mobile device, validating the task at the replenishment line level.

4. Monitoring & Reports

- **Replenishment List:** A central list is available to view and manage all created replenishment tasks.
- **Anomaly List:** A dedicated report can be generated on demand to identify any issues or errors in the replenishment process (e.g., source shortages, invalid parameters).
