

Topic: Replenishment Management

Access Path: Preparation / Replenishment

Primary Function: To select and validate the movement of stock to picking locations.

1. Replenishment Selection

You can initiate a replenishment task using several selection methods:

- **Replenishment Window: The primary interface for selection.**
- **Picking Location: Select directly from a specific picking location that needs stock.**
- **Specific Item: Select based on a particular item that requires replenishment.**

Filtering: After selecting a general Site, you can apply additional filters to narrow the selection further based on:

- **The collection site (where stock is taken from).**
- **The restocking drop-off site (where stock is delivered to).**

2. Replenishment Validation

Replenishment tasks can be validated in two ways:

- **Partial Validation: Confirm the completion of only a portion of the requested replenishment quantity.**
- **Total Validation: Confirm the completion of the entire requested replenishment quantity.**

Note: For detailed procedures and rules governing validation, please refer to the dedicated system documentation sections for validation.
