

Automatic Search Location – Assigning Planned Locations Automatically

Purpose:

- Automatically determine a planned location for each receipt line, instead of assigning it manually.
 - Optimizes storage placement based on predefined rules.
-

Steps

1. Select the receipt lines for which you want to perform the automatic search.
 2. Either:
 - Right-click → Launch automatic search, or
 - Click the Location search button at the bottom-right of the window.
-

System Behavior

- SpeedWMS proposes the most optimized storage location for each support based on the criteria of the automatic search rule:
 - Zone type
 - Stock constraints
 - Item characteristics
 - Capacity limitations
 - If the system cannot find a suitable location for a line (e.g., storage zone full, criteria not met), the “Search completed” box remains unchecked.
-

Key Point:

Automatic search saves time and ensures consistency but may require manual intervention for lines where no suitable location is found.
