Initialize Picking Location search

SQL time : 00 s 02Bols

The following will be specified in particular for each support entered:

- .Its current location, which matches the location of the reception
- .The reference picking layout for the item
- .The intended location of destination, blank by default in administrative mode
- .The status of the support, depending on the status of the activity

The ranking will be done either declaratively or through the use of parameterized location search rules.

Note that it will be possible to store the goods directly on their picking location. The button *Initialize picking* will allow you to directly enter the picking location as the destination location of the selected lines.

Whichever method is chosen, the result will be the same: it is a question of obtaining a planned location for each line of the reception.
