

SpeedWMS – Status of a Support

When stock is generated during reception, each storage support (e.g., pallet, bin) is assigned a status depending on its handling and location assignment.

Initial Status After Reception

1. 01 – Support in place

- Support is already in its location.
- Typically used when locations are not managed.

2. 02 – Location to be assigned

- Support is on the reception platform.
 - Destination location is unknown at this stage.
-

Assigned Location

- When a destination location is assigned (manually in the Storage tab or via automatic location search), the support status changes to:
- #### **3. 03 – Movement to be performed**
- Support knows its planned storage location, but has not yet been moved.
-

After Movement

- Once the support is moved to the planned location:
 - Status changes from 03 → 01
 - Initial location is replaced with the planned location.
 - The movement is recorded in Speed history.
-

✓ Key Notes:

- Status 01 can represent both “already in place” and “moved to its destination.”
- Status 02 is temporary until the system or user assigns a location.

- **Status 03 indicates a pending move—critical for tracking warehouse operations.**
