

Clarins Shortfall Order – Mission Location Update Procedure

Sensitivity: Internal

Client: Clarins

System: Speed WMS

Audience: Support / Technical Team

Purpose

This procedure is used when a Clarins order has been launched and results in a shortfall, even though:

- The SKU or LPN is confirmed to be in stock, and
- The order line is missing a valid picking location at launch time.

In this scenario, the mission must be manually updated to assign the correct picking location.

Preconditions

Before modifying any mission lines, verify the following:

- The SKU exists in stock
 - The LPN exists and is available
 - The stock is located in a valid active picking location
 - The mission line has a status below 040
-

Step 1: Identify Affected Mission Lines

Retrieve all mission lines for the affected SKU that are not yet validated.

```
SELECT MIL_KEYU, MIL_EMP, *  
FROM MIL_DAT  
WHERE ART_CODE = '80110136'  
AND MIL_STAT < '040';
```

Confirm that the order you are working on appears in the result set.

Step 2: Determine the Correct Picking Location

- Identify the correct stock location (STK_LIEU) from which the SKU should be picked
 - Copy the MIL_KEYU(s) associated with the affected order line(s)
 - Copy the target picking location
-

Step 3: Update the Mission Line Picking Location

Assign the correct picking location to the mission line.

UPDATE MIL_DAT

SET MIL_EMP = 'CA002A035',

MIL_EMPO = 'CA002A035'

WHERE MIL_KEYU IN (144522, 147153);

Expected Outcome

- The mission line is now linked to a valid picking location
 - The shortfall condition is resolved
 - The order can proceed through validation and picking
-

Important Notes

- This procedure applies only to Clarins
- Mission lines must have MIL_STAT < '040'
- Updates must be performed by Support, due to database access restrictions
- Always validate stock availability before modifying missions
