

Resolving Missing Weights on GDNs / Picklists (Commodities – Durban)

1. Background

Missing weights typically occur when:

1. An order is validated and then brought back to Seizure status:
 - Weights are initially stored in REL_DAT and inherited by STK_DAT.
 - When stock leaves the system, this information is cleared from STK_DAT.
 - Returning stock does not automatically repopulate STK_DAT.
 2. During reception, weight information may not have been correctly inherited into STK_DAT.
-

2. Step-by-Step Resolution

Step 1 – Check the Order Status

Ensure the order is editable (not validated):

```
SELECT *  
  
FROM ope_dat  
  
WHERE ope_nooe = 'order_number'  
  
AND act_code = 'zar';
```

Step 2 – Check Missions Linked to the Order

Review all missions associated with the order:

```
SELECT *  
  
FROM mil_dat  
  
WHERE ope_nooe = 'order_number'  
  
AND act_code = 'zar';
```

Note: Some supports may already be validated (picked); only unvalidated supports can be updated.

Step 3 – Update Valid Supports

Copy the weight data from REL_DAT to STK_DAT. Replace 'support_number_1', 'support_number_2', ... with the actual support numbers from MIL_DAT:

UPDATE s

SET

s.stk_num13 = r.rel_num13,

s.stk_num15 = r.rel_num14,

s.stk_num16 = r.rel_num15,

s.stk_num17 = r.rel_num15

FROM stk_dat s

JOIN rel_dat r

ON s.stk_nosu = r.rel_nosu

AND s.act_code = r.act_code

WHERE s.stk_nosu IN ('support_number_1', 'support_number_2', ...)

AND s.act_code = 'zar';

Step 4 – Verify the Fix

- Print the GDN / Picklist.
 - If weights now appear correctly, no further action is needed.
-

Step 5 – If Weights Still Don't Show

1. Go back to MIL_DAT.
 2. Invalidate all lines that were already picked.
 3. Rerun the update query from Step 3.
 4. Print the GDN / Picklist again to confirm weights are correctly displayed.
-

Notes

- Only update unvalidated supports to avoid inconsistencies.

- **Always verify after each update by printing the report.**
- **Keep a record of affected support numbers for audit purposes.**
