

Handling Issues with Unknown Supports

Sensitivity: Internal

System: Speed WMS

Audience: Support / Technical Team

Purpose

This procedure is used when an order encounters unknown support issues, typically caused by support numbers not being correctly validated or loaded.

Step 1: Check Mission Details in Speed

1. Navigate to Preparation Module → Manage Missions.
 2. Open the Validated tab.
 3. Filter the list to locate the affected mission.
 4. Double-click the mission to open the mission details.
-

Step 2: Verify Support Numbers

- Confirm that both support numbers are visible:
 - iLPN
 - 0LPN
 - If both supports are present, proceed to database verification.
-

Step 3: Check Support Status in the Database

Use the following query to identify supports that are still in status 020:

```
SELECT *  
FROM SEX_DAT  
WHERE SEX_STSUP = '020'  
AND SEX_NOOE = 'order number'  
AND SEX_ACT = 'ZAR';
```

Step 4: Identify the Issue

- Supports with status 020 indicate that they are not yet validated
 - These supports must be updated before containers can be loaded
-

Step 5: Update Support Status to Validated

If support numbers are found with status 020, update them to 040:

UPDATE SEX_DAT

SET SEX_STSUP = '040'

WHERE SEX_STSUP = '020'

AND SEX_NOOE = 'order number'

AND SEX_ACT = 'ZAR';

Step 6: Request Container Loading

- Once the update is complete, notify the Operations team
 - Operations can now load the containers successfully
-

Expected Outcome

- Support numbers are validated (040)
 - Unknown support issue is resolved
 - Containers can be loaded without errors
-

Important Notes

- This procedure requires database access and must be executed by Support
- Always verify support visibility in iLPN and 0LPN before updating the database
- Ensure the correct order number and activity code are used
